OKLAHOMA STATE AND COUNTY POPULATION PROJECTIONS THROUGH 2070

Preface:

This report describes Oklahoma's projected future population based on historical population data and rates of fertility, mortality, and migration. These projections provide planners and policy makers with possible outcomes of a series of demographic events.

It is important to note that Oklahoma is susceptible to many unpredictable events, and that no demographer or economist is able to foresee the future. Our projections are based on past and hypothetical future population trends.

Special acknowledgment goes to the Oklahoma Department of Health for providing essential information for these projections.

We welcome comments or suggestions on the content or format of this publication. Many of the most requested statistics in this document are also available on the Research and Analysis website at laborstats.alaska.gov. Send requests for demographic projections information to Jon Chiappe, Director Research and Economic Analysis Division, Oklahoma Department of Commerce, 900 N Stiles Avenue, Oklahoma City, OK 73104 Telephone: (405) 815-6552; e-mail: jon.chiappe@okcommerce.gov.

Executive Summary

Oklahoma's population is projected to top 4.5 million by the time the state celebrates its 150th birthday.

- By the 2030 Census, Oklahoma's population will edge close to 4.1 million
- By the 2050, Oklahoma's population will top 4.37 million
- By 2070, Oklahoma's population will edge closer to 4.75 million

Oklahoma's population is forecasted to grow at an average annual rate of **0.395%** over the next 50 years, equivalent to the US Census Bureau's most recent national growth forecasts through 2050. The Census Bureau does not have state level population forecasts.

Counties surrounding present day Tulsa and Oklahoma City metro areas are forecasted to see substantial population growth. In 2020, the 14 counties currently included in the Tulsa and Oklahoma City MSAs combined to represent 61.7% of the state's total population, but by 2070 those same 14 counties are forecast to

2020 Population for Counties That Make Up Present Day Tulsa and OKC MSAs

Source: Oklahoma Department of Commerce

There are 43 counties in Oklahoma forecast to experience population decline over the 50 years. Many of these counties, mostly in western Oklahoma, experienced their peak population levels in 1910, shortly after Oklahoma achieved statehood. While these counties are expected to continue to experience population declines, the rate of decline is expected to slow over the coming decades.

Counties forecast to experience population decline between 2020 and 2070				
Adair	Cotton	Jackson	McIntosh	Pushmataha

Cimarron	Harmon	Lincoln	Ottawa	Washita
Coal	Haskell	Marshall	Pawnee	
Comanche	Hughes	Mayes	Pittsburg	

Methodology

General Discussion of Projection Formulas

State level projections used in this report start with population counts revealed under the 2010 Decennial Census and follow generally accepted forecasting routines developed by the US Census Bureau. For simplicity, the basic demographic formulas used in this report are as follows:

Population in the current year

+ Births in the current year

- Deaths in the current year

+ Net migration Equals

Population projection for the next year

Population projection for the next year

+ estimated births in the current year, based on fertility rates and # of women of childbearing age

- Deaths in the current year

+ Net migration Equals

Population projection for the following year

What Population Groups Are Included in Projections

All population figures cited in this report, whether historic counts or forward-looking projections, include the following:

- All civilian residents living within the state
- Members of the US Armed Forces stationed within Oklahoma
- All persons incarcerated in the state of Oklahoma, including out of state prisoners held at private prisons located within the state.

Projection of Births and Fertility Rates

This report uses statewide and county total fertility rates from Oklahoma Department of Vital Statistics.

- In almost all except two counties (Logan and Woods) the dominant childbirth age for females is 20-24
- The next age group 25-29 is consistently second except for those counties where it was first.
- Among women aged 35-49, there were 15 births per 1,000 women

While birth rates have been generally declining across the United States and in Oklahoma for some time, that rate of decline has also been slowing in recent years. Further, the state's growing Hispanic population typically has a higher birth rate than the rate shown for the population in total.

This report does not project populations by race or ethnicity, but it is assumed that the state's Hispanic population will continue to grow. As the percentage of Hispanics in Oklahoma increases, it is also assumed that the rate of decline in the state's overall birth rate will slow or possibly reverse. Because of the uncertainty surrounding the longer-term direction for birth rates in Oklahoma, the population projections in this report assume that the overall birth rate will remain constant over the longer term.

Projection of Deaths

United States survival rates by single age and gender for 2019 were obtained from the US Centers for Disease Control at [United States Life Tables, 2019 \(cdc.gov\)](https://www.cdc.gov/nchs/nvsr/nvsr.htm) and are included in Appendix 2.

State and County survival rates were used to calculate Oklahoma life expectancy for each age group over the next 50 years. Those survival rates are not likely to remain static with improvements in health care technology and Oklahoma embarking on efforts like smoking reduction programs and diabetes awareness efforts to change the state's overall health characteristics. However, the rapid onset of other health concerns, like the national epidemic of obesity, could also adversely impact the state's longer term life expectancy figures.

Because of the difficulty in forecasting future changes in life expectancy, Oklahoma's age specific survival rates are assumed to remain constant for the purposes of the populations projections contained within this report.

Projection of Net Migration

As difficult as the previous variables are to project, migration is likely even more difficult to gauge. As the state's previous population projections report stated following the release of the 2010 Census results, "The only consistency in Oklahoma's recent migration history has been its unpredictability."

How volatile is this component of population growth? Between 1970 and 1983, Oklahoma's overall population growth rate grew at a heated pace, reaching peak annual growth of 3.6% in 1982. Some less populated counties in eastern Oklahoma, driven in part by new oil discoveries and well construction, experienced double digit annual percentage growth. Then by 1987 the state's annual population growth rate dropped to -1.3% and some of those same double digit growth counties were showing nearly double digit declines. Appendix 3 shows more detailed information about the history of Oklahoma's components of population change, including net migration figures.

Between 1960 and 2011, Oklahoma's population gain due to net migration averaged slightly over 10,000 people annually, with swings ranging from a gain of 80,500 in 1982 to a decline of 61,000 in 1987.

Ignoring the volatility found in the 1970s and 1980s, and limiting net migration to the 1990s and 2000s, Oklahoma's average annual net migration gain was just under 15,000. For this analysis, the state's annual population growth figure has been assumed to run at a consistent rate of adding 15,000 people annually. More recent patterns show a trend of Oklahoma adding 20,000-35,000 net new migrants. In future updates the migration rates may be adjusted to reflect the more recent trends that have held consistently over time.

County Population Projections

County population projections were obtained using a more generalized process than the statewide approach already outlined above. The Cohort Component method was primarily used to estimate population growth levels, while it is the preferred and proven method of calculating long-term population projections, it is less effective in considering recent and near term infrastructure investments by communities that will help better retain and attract more residents as a quality of life improvement. We have seen some unprecedented levels of investments by communities and we would recommend exploring other options for prediction where these factors are dominant. One example of a county with significant recent investments and jobs investment is Mayes, County.

In addition to the Cohort component, alternative projections at the individual county levels could be achieved by using exponential smoothening and random forest model by using the single year data available from U.S. County Population Data - 1969-2020. [Download U.S. County Population Data - SEER Population Data \(cancer.gov\)](https://seer.cancer.gov/population/). These alternatives may be included in future updates of this report.

Matching up the Two Methodologies

The projected Oklahoma counties population for 2030 and beyond for each age-cohort is developed by aging forward the 2020 population using the averaged CPRs and CCRs. The total Oklahoma population for 2030 and beyond from the *Hamilton-Perry method can be calculated by summing across all age-cohorts. We construct the projected Oklahoma counties populations for 2030 and beyond for each age-interval, by redistributing the Oklahoma population for 2030 as per the age-distribution of the Oklahoma population for 2030 from Hamilton-Perry method.

The first state level projection for 2030 is set after calculating the projected Oklahoma population for 2030 from *Hamilton-Perry age forwarding. Next, the total Oklahoma population for 2030 from Hamilton Perry method is calculated by summing across all age-cohorts. The projected Oklahoma population for 2030 for each age-interval is set as per the age-distribution using the Hamilton-Perry method results for 2030. Subsequent projections for 2040, 2050, 2060, and 2070 are generated using the same approach and repeating the previous process.

Assumptions and limitations:

There is always uncertainty surrounding population trends. For instance, economic conditions or land use decisions can shift migration patterns or medical breakthroughs can increase life expectancy. In year 2020 particularly, the pandemic had affected population growth and migration patterns across the nation and world. Migration patterns are particularly subject to large and sudden swings.

This instability in demographic trends has been on display in the years since the Great Recession. Oklahoma's fertility rates and migration rates have been on the rise since 2009, and the state has been growing at its highest rate since the late 1980s. According to the U.S. Census Bureau's population estimates, Oklahoma has added roughly 50,000 residents per year between 2010 and 2017, up significantly from its average annual growth of approximately 40,000 per year between 2000 and 2010. The 2020 Census reflected some downturns during the pandemic and there were known issues with reaching the full population counts, especially in rural areas of the state.

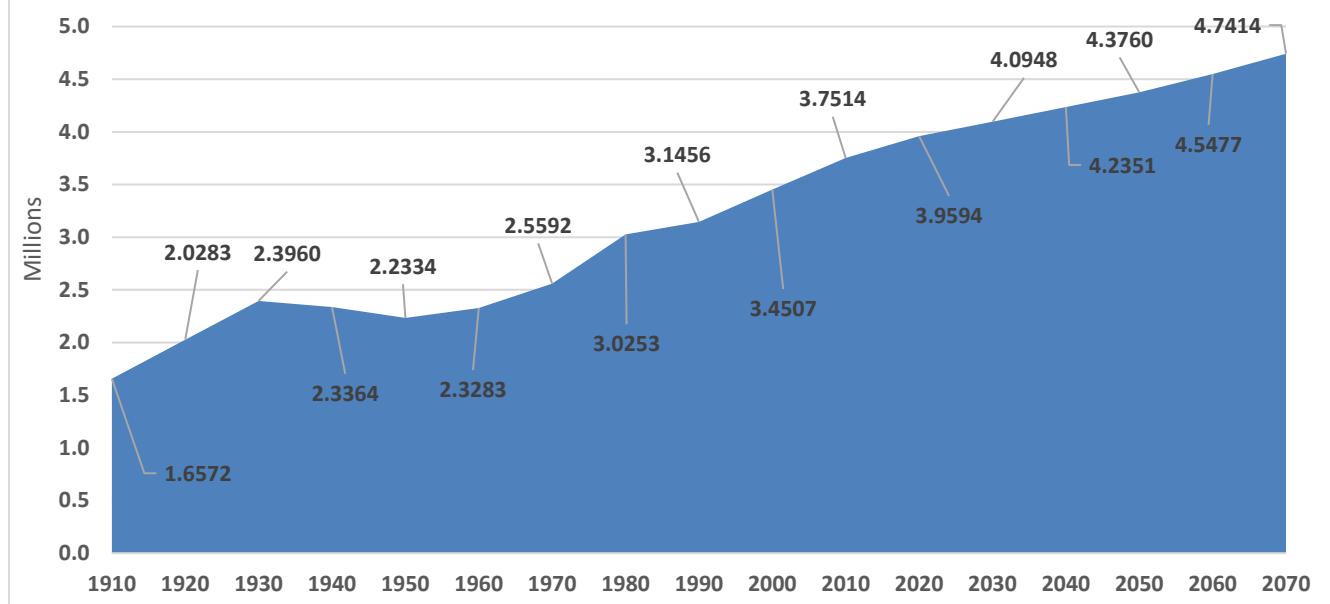

Additionally, without the release of reliable single year age data from the 2020 Census, we had to rely on relative age groupings from more recent (2019 ACS data) and use latest available single year age distribution from 2010 to supplement our findings.

The most important assumption introduced into these projections is that this slower growth in some of the more rural areas will continue. With the trends in economic development and changes in land use, some

counties across Oklahoma are expected to reduce losses and stem growth in their communities. Investments in key infrastructure like broadband could allow communities to attract more opportunities and retain more residents and businesses than was possible before those investments. In future updates some of those factors may be better reflected in the baseline estimates, which in turn will lead to stronger projections.

Oklahoma Statewide

Oklahoma Statewide Growth and Projections 1910-2070

Oklahoma's statewide population projection was built using the sum of population projections for all 77 counties. Annual growth rates are forecast to average 0.395%. This is more conservative than the state's average annual growth rate of 0.86% over the last three decades.

The following pages contains tables showing Oklahoma's statewide Decennial Census populations going back to statehood; annual population estimates going back to 1960; population projections from 2020 to 2070; and population projections by 5-year age group through 2070 for males, females and the total population.

Decennial Census Population Counts

Adair County

Adair County

Adair County's population is forecast to decline at approximately - 0.14% on an average annual basis over the next 50 years. This forecast was developed using a cohort component calculation with key consideration to 2010 through 2020 populations and the age and fertility rates of the female population. Alternative forecasts may have Adair County growing especially considering Oklahoma's high net in migration and the strong broadband infrastructure in the county.

Alfalfa County

Alfalfa County

Alfalfa County is forecast to experience a growth in population over the next 50 years, stemming a constant decline since statehood. While a higher rate of decline is expected in the immediate term, later decades are expected to experience lower rates of decline. Over the full 50-year span, the increase is forecast to average an annual rate of 1.16%. The growth rate is more aggressive than many across the state, but the base population is also very small, slight increases in population will appear amplified relative to larger counties. The 2021 estimate has the population remaining roughly steady. With recent infrastructure investments the trend should continue reflecting growth as more of the female population elect to remain in the county.

Atoka County

Atoka County is forecast to experience population decline rates over the next 50 years. Between 2020 and 2070, Atoka County's expected average annual decline rate is -0.52%. The Cohort component analysis indicates a decline based on recent fertility and female populations. Population estimates for 2021 indicates a trend towards growth in the future, this reverse in trend from projections is supported by recent infrastructure developments and regional attraction investments made by communities within Atoka County.

Beaver County

Beaver County

Beaver County's population is forecast to experience an average annual rate of decline of -0.39% over the next 50 years. Actual year to year population numbers may swing higher or lower than expected, but the overall trend is likely to remain in the general direction but perhaps at a slower rate in future years.

Beckham County

Beckham County

Beckham County's population is forecast to grow at an average annual rate of 0.89% over the next 50 years. Volatility in the county's population has historically been influenced by developments in the energy sector. Up and down swings in population from year to year are expected to continue, much like they have since 1960. However, the long-term growth trend is expected to generally follow the levels indicated by the graph above.

Blaine County

Blaine County

In 2010, after 12 years of operation, a large private contract correctional facility in Blaine County closed. Those inmates represented approximately one sixth of the county's population before being transferred to other facilities. The assumption in projections is that the facility continues to be closed or have limited occupancy. There is a high level of long-term uncertainty associated with projections for Blaine County, but over the next 50 years the population is estimated to decrease by roughly -1.29% annually based on the cohort component trends primarily driven by the female population.

Bryan County

Bryan County

Bryan County's population is forecast to average a 1.01% annual growth rate over the next 50 years. Bryan County has made significant investments in infrastructure and the attraction of major manufacturing and distribution facilities. Bryan County is expected to continue growing as investments and people continue to locate in the county especially from the more crowded and costly North Texas region.

Carter County

Carter County

Although Carter County's population is projected to fluctuate from year to year, using the cohort component model results in an overall upward trend. Over the next 50 years, Carter County's population is forecast to grow at an average annual rate of 0.09%. Additionally with recent infrastructure and business investments, Carter County is estimated to maintain that upward trend.

Choctaw County

Choctaw County

Choctaw County experienced its peak population in 1920, the population has experienced fluctuations over the decades since then with a general downward trend. There has been a slow but steady decline in population since 2000. The population estimate for 2021 actually shows a slight increase in population versus a significant dip in 2020. Choctaw County is forecast to experience a slight average annual population decline of -0.25% between 2020 and 2070. The cohort component method forecasts a decrease consistent with the overall trend over the past two decades, but with increased investments in infrastructure and businesses there may a slow and reverse in trend from year to year.

Cimarron County

Cimarron County

Cimarron County is forecast to experience continued population decline over the next 50 years, though the pace of that decline is expected to gradually slow over time. Between 2020 and 2070, the rate of population decline is expected to average -0.82%. The cohort component method was used to develop Cimarron County's long-term population forecast and the fit appears to be strong. While some year-to-year variation is expected, swings up and down are expected to be relatively minor.

Cleveland County

Cleveland County

Cleveland County is forecast to have an average annual growth rate of 0.49% over the next 50 years, significantly below the 2.34% population growth rate experienced over the previous two decades. The cohort component method shows a strong balance with population growth patterns between 1960 and 2010, and little variation among long range population forecasts is expected.

Coal County

Coal County

Coal County's population growth has remained relatively flat over the last 50 years, with only a slight decline pattern expected between now and 2070. From 1960 to 2010, Coal County has shown 0.14% average annual growth, and average annual decline over the next 50 years is expected to be at -0.60%. While some slight up and down variation may be expected, the overall population trend will most likely remain predominantly flat.

Comanche County

Comanche County

Comanche County is forecast to experience -0.52% population decline between 2020 and 2070. The County has experienced continued up and down swings in population since 1960, but the long-term trend has remained generally positive. The cohort component analysis forecast the population counts are expected to occur between now and 2070.

Cotton County

Cotton County

Cotton County is forecast to have a -1.28% average annual population decline over the next 50 years. The cohort component analysis has a relatively good historical similarity, with greater volatility shown in the 1960s and 1970s. Some year-to-year variation from population forecasts is expected, but the variation is likely to be relatively small.

Creek County

Creek County

Creek County's population is forecast to grow at an average annual rate of 0.48%, slightly above the forecast state growth rate. While growth has slowed somewhat over the last 5 years, the cohort component analysis retains a relatively strong conformity with the historic data and is expected to be a good indicator for future growth patterns.

Custer County

Custer County

Custer County is forecast to have a 1.22% average annual rate of population growth over the next 50 years based on the cohort component formula. The county's population historic data from 1960 to 2010 shows a lower degree of consistency, but that is largely due to a strong population growth spurt followed by a sharp population decline during the 1980s. Removing that one-time peak would result in a significantly improved overall fit for the historic statistics. Some year-to-year variation from forecasts is expected.

Delaware County

Delaware County

Delaware County is forecast to experience an annual average decline rate of -0.33% over the next 50 years. The cohort component analysis is a poor assessment with the historic pattern of growth experienced by the county over the last half century, but should be a very good indicator of future declining trends. Little year to year variation is expected.

Dewey County

Dewey County

Dewey County is forecast to have a continued growth in population, but the pace of that growth is forecast to increase over the next 50 years. On average, the annual rate of growth is forecast to be a robust 2.08%. While Dewey County experienced some population growth in the late 1970s and early 1980s, led by growth in the energy sector, the overall trend has been downward since the 1930s. The cohort component analysis indicates the population will rise over the next 50 years.

Ellis County

Ellis County

Ellis County is forecast to experience continued but slowing population decline over the next 50 years, based on the cohort component. The analysis indicates Ellis County's population will decline at an average annual rate of -0.29%, with a somewhat higher rate in the short term and lower rates in the longer term. Some year to year variation from these projections is expected due to the influence of energy developments in the county.

Garfield County

Garfield County

Garfield County is expected to achieve a slight population growth over the next 50 years, growing at an average annual rate of 0.26%. The cohort component method indicates a slow but relatively steady growth trend, but the quality of the formula's analysis indicates a high likelihood of year to year variation from the overall trend.

Garvin County

Garvin County

Garvin County is forecast to have fundamentally uniform long-term population growth over the coming 50 years, with an overall average annual growth rate of 0.30% from 2020 to 2070 based on the cohort component. However, the trend indicated by the measure of comparison with the historic data suggests that there is a high likelihood of year to year variation from population forecasts.

Grady County

Grady County

Grady County is forecast to experience population decrease over the next 50 years. Grady County's population is expected to decline at an average annual rate of -0.22% between now and 2070 based on the cohort component analysis. This indicates that there will likely be only small degrees of year-to-year difference in population forecasts over the duration of this time period.

Grant County

Grant County is forecast to experience a slowing rate of population growth over the coming 50 years, as indicated by the cohort component. The county's average annual population rate of growth is expected to be 0.69%, with a higher rate of growth in the short term and a slower rate of growth experienced in the longer term. The cohort component analysis indicates relatively low year to year variation in population forecasts.

Greer County

Greer County

Greer County's population history over the last 50 years indicates a slow but consistent rate of population decline, forecast to average -0.12% annually over the next 50 years. The cohort component indicates a high degree of consistency, leading to the conclusion that there will be little year to year variation from the overall long term population forecasts.

Harmon County

Harmon County

Harmon County is forecast to experience a declining average annual population rate of -0.67% between now and 2070. Historic population trends in the county revealed a reduced rate of population decline and the cohort component indicates a strong level of consistency in comparison. Year to year variation from population forecasts is expected to be relatively low.

Harper County

Harper County

Harper County is forecast to have an increasing rate of population growth over the coming years, with the annual rate of growth averaging 0.24% between now and 2070. The rate of growth is forecast to be somewhat higher in the short term, and lower in the long term. The level of accountability for Harper County's cohort component analysis is strong, indicating a slight year to year variation from population forecasts.

Jefferson County

Jefferson County

Jefferson County is projected to experience a declining rate of population reduction, with a -0.19% average annual rate projected through 2070. Since 1960, Jefferson County experienced an average annual rate of decline of -0.42% and the cohort component analysis indicates that the extent of decline will decrease slightly over the next 50 years. Some year to year variation in the overall population patterns can be anticipated.

Johnston County

Johnston County

Johnston County's population forecast shows a 0.49% average annual growth rate over the next 50 years. While slightly above the anticipated 0.395% average annual statewide growth rate, this is relatively close to the county's historic average annual growth rate of 0.57%. The cohort component analysis shows a reasonable level of consistency, but some year to year variability is anticipated.

Kay County

Kay County

Kay county is forecast to experience an average annual rate of population decline of -0.44% over the next 50 years based on the cohort component. This is greater than the -0.18% average annual rate of decline indicated by county population patterns since 1960. However, even after accounting for high growth rates experienced in the 1980s and volatility, the long-term forecast is for a slow population decline overall. Some year to year variation in the population forecasts can be expected.

Kingfisher County

Kingfisher County

Kingfisher County's population growth rate is expected to average 0.75% annually between now and 2070 based on the cohort component method. The county has averaged 0.83% annual population growth since 1960, with very high growth rates in the early 1980s followed by high population declines in the late 1980s. The historic data assessment indicates a possibility of volatility. While the overall trend is for positive growth, year to year variations can be expected.

Kiowa County

Kiowa County is forecast to experience a slowing rate of population decline over the next 50 years, averaging a -0.45% decline through 2070 based on the cohort component method. The rate of decline is anticipated to be higher in the short term, and slower in the long term. Between 1960 and 2010, the region experienced an annual average decline of -0.73% in population. However, year to year variation from the county's population forecasts can be expected, and are anticipated to be relatively small.

Le Flore County

Le Flore County

Le Flore County is forecast to experience a -0.19% average annual population reduction through 2070, moderately below the forecasted amount for Oklahoma's overall growth of 0.395%. The cohort component indicates that the year to year variation from the long term forecast may be relatively small.

Lincoln County

Lincoln County

Lincoln County is forecast to have an average annual population decline rate of -0.019% over the next 50 years based on the cohort component method, following a previous growth pattern. This is lower than the expected statewide average annual growth rate of 0.395%. Indicators predict the likelihood that year over year variation from forecast population levels will be relatively small.

Logan County

Logan County

Logan County's population is forecast to achieve an average annual population growth rate of 0.76% over the coming 50 years. It should be noted that since 2005 the county has averaged an annual growth rate of 3.64% and that the county may be entering a growth spurt comparable to the early 1980s. However, that spurt ultimately returned to the long term growth rate indicated by the cohort component analysis in the above graph. The overall year to year variation is expected to be low.

Love County

Love County

Love County is forecast to experience an average annual growth rate of 1.01% over the next 50 years based on the cohort component. This is slightly above the anticipated statewide growth rate of 0.395%. The analysis projects a higher likelihood that forecast populations will be on target over the long term. Some year-to-year variation in population projections are to be expected but should be relatively small.

McClain County

McClain County

McClain County is forecast to grow at a 0.36% average annual growth rate over the next 50 years based on the cohort component method, very similar to the growth rate expected for the state as a whole during that time period. It can be anticipated that little year over year variation from forecasts is expected.

McCurtain County

McCurtain County

McCurtain County is forecast to have an average annual growth rate of 0.95% between now and 2070 based on the cohort component method. However, the historical data displayed a high growth in the early 1970s and not reflecting a gradual rate of decline that was in effect since the late 1970s. Year over year variation is expected.

Major County

Major County is forecast to experience a slow level of population growth over the coming 50 years, averaging an annual growth rate of 1.37% based on the cohort component. High volatility in the county's population, particularly during the 1970s and 1980s, hold strong influence on the historical modules overall degree of match. As a result, it is likely that the long term forecasts will experience a high level of year to year variation when measured against final population counts. Over the long term, however, the upward trend is expected to continue.

Murray County

Murray County

Murray County is forecast to have a 0.58% average annual population growth through 2070, up very slightly from the 0.54% population growth rate over the previous 50 years. Exceedingly high population growth rates experienced during the late 1970s and early 1980s help to bring down the overall assessment to the historical trend and the county may expect to see year to year up and down fluctuations different from forecasted population levels.

Muskogee County

Muskogee County

Muskogee County's population is expected to average a 0.36% annual growth rate over the next 50 years. This is a little below the expected statewide level of growth but is a slight increase over the county's 0.29% annual average growth rate experienced between 1960 and 2010. Muskogee County's historic trend is relatively consistent with the forecast, with only a small amount of year-to-year variation from forecast population levels expected.

Noble County

Noble County

Noble County's population is forecast to experience a -0.19% average annual decline rate over the coming 50 years. From 1960 to 2020 there have been annual fluctuations, but the overall annual growth was only 0.10% annually. The county has shown relatively high population swings between 1960 and 2020 when placed in the context of the county's total population. It is likely that volatility in the county's population will continue from year to year. The current cohort component calculations are not as reflective of the annual fluctuations in population.

Nowata County

Nowata County

Nowata County is forecast to experience a reduction in population growth over the next 50 years with an average annual decline rate of -0.025%. Some swings in population are expected from year to year with a general downward trend in population counts. From 1960 to 2020, the county has experienced an average annual rate of decline equaling -0.29%. Nowata is close to a growing Tulsa metro and very close to 3 bordering states (Kansas, Missouri and Arkansas).). As economic activity increases in the region, the population of Nowata should experience a halt in decline and an eventual growth in the region.

Okmulgee County

Okmulgee County

Okmulgee County is forecast to see a minor annual decline rate, averaging -0.34% between now and 2070. This is less than the average annual growth rate experienced between 1960 and 2010. Volatility in population levels over the past 50 years mean that the tendencies comparisons against actual historical numbers is convincing but not without up and down swings. Year to year variation from long term population forecasts are expected.

Osage County

Osage County

Osage County is forecast to have a -0.34% average annual decline rate, noticeably lower than the expected state rate of growth between now and 2070. However, this is considerably below the county's 0.93% average annual growth rate experienced between 1960 and 2010. Population volatility in the 1960s and 1970s assisted to lessen the previous overall assessment, but year to year variation against the long-term population forecast is not expected to be high.

Ottawa County

Ottawa County

Ottawa County is forecast to have a -0.025% average annual decline rate between now and 2070 based on the cohort component. This is differing from the 0.25% average annual growth rate experienced since 1960, although there have been some population oscillations up and down during that time. For that reason it is expected that there will be year to year variation from specific population forecasts, but the overall trend should continue on the projected decreasing gradient.

Pittsburg County

Pittsburg County

Pittsburg County's average annual decline rate formulated from the cohort component is forecast to be -0.40% between now and 2070, a modest reduction in the 0.67% growth rate experienced between 1960 and 2010. Over the last 50 years, the county has shown steady growth, with a small degree of variation from the overall trend. The county's year to year population variation is expected to remain relatively slight.

Roger Mills County

Roger Mills County

Roger Mills County is forecast to experience an average annual increase in population of 0.26% over the next 50 years based on the cohort component analysis. The rate of growth is expected to be most pronounced in the short term, with the rate of longer-term population growth expected to gradually slow. The historic population data indicates a fair degree of uniformity but some variation from year-to-year population forecasts can be expected.

Rogers County

Rogers County

Rogers County is forecast to experience a 0.11% average annual growth rate over the coming 50 years formulated from the cohort component, less than the rate of growth forecast for the state as a whole. The historic population data indicates a resilient dependability and year to year variation in population forecasts are expected to be relatively slight.

Seminole County

Seminole County is forecast to have a slight population decline over the next 50 years, with an average annual rate of decline of -0.27% between now and 2070. This is based on the cohort component and is slightly higher than the -0.18% average annual rate of decline experienced over the last 50 years, where the decrease has consistently been gradual but clear. The earlier data indicates a reasonable measure of reliability, with some degree of year-to-year variation from projections expected.

Sequoyah County

Sequoyah County

Sequoyah County is forecast to experience an average annual decline rate of -0.34% over the next 50 years based on the cohort component method. A review of the past 50 years of population growth for the county yields the framework for a convincing level of stability . Year to year variation from forecasts are expected, but should be relatively slight over the long term.

Stephens County

Stephens County

Stephens County is forecast to experience a very gradual rate of population decline, averaging -0.44% annually utilizing the cohort component. This is practically contrary to the county's historic average annual growth rate of 0.37%. Strong growth in the 1970s and early 1980s, offset by a declining population level in the late 1980s, combine to reduce level of historical relationship based on the last 50 years of population trends. Year to year variation from forecasts are likely, but the long-term trend of population growth is expected to continue.

Texas County

Texas County is forecast to experience an average annual population decline rate of -0.17% over the next 50 years based on the cohort component method. A steep drop in population experienced in the late 1980s was offset by a rapid increase in population over the 1990s. The growth slowed in 2000s and started declining in 2014. The population in 2020 was a sharp increase compared to 2019. Significant business investments and the increase in Hispanic and international migrants are some factors that could change the growth outlook for Texas County. Some year-to-year population variation from forecasts may be expected, but the long-term growth trend is expected to continue.

Tillman County

Tillman County

Tillman County is forecast to experience a continued population decline, averaging -0.63% annually between now and 2070 determined by the cohort component. The rate of decline is expected to be most pronounced in the short term, with a gradual slowing in the longer term. Between 1960 and 2010, the county experienced an average annual rate of decline of -0.91%.

Tulsa County

Tulsa County

Tulsa County is forecast to have a 0.46% average annual population growth rate over the next 50 years based on the cohort component, moderately above the projected national and statewide growth rates. This is a reduction compared to Tulsa's average annual growth rate of 1.49% from the prior 50 years but reflects a similar growth rate expected to occur statewide and nationally. Trends drawn over the county's population history since 1960 show a sound uniformity.

Wagoner County

Wagoner County

Wagoner County is forecast to experience a 0.31% average annual growth between now and 2070. This is based on the cohort component and is narrowly lower than the statewide growth rate forecast for the same period. Tendencies represented from historic population data since 1960 indicates a strong level of reliability, with slight year to year variation expected from the overall trend.

Washington County

Washington County

Washington County is forecast to have an average annual growth rate of 0.18% over the next 50 years illustrated by the cohort component. The county experienced strong population growth in the 1970 and early 1980s, but that growth was partially offset by population declines over the mid to late 1980s. These events combine to reduce the overall stability for the county's population trend. While some year-to-year variation in population forecasts can be expected, the long-term upward growth trend is expected to continue.

Washita County

Washita County

Washita County is forecast to experience a -0.53% average annual rate of population decline over the next 50 years established on the cohort component. However, the possibility of strong year to year variation is expected based on the strong population swings experienced in the 1960s, 1970s and 1980s. The trend based on historic population counts over the last half century shows a little reliability. Because the county's population appears to have stabilized over the last two decades, it is possible that the declining trend will stabilize.

Woodward County

Woodward County is forecast to have a 0.25% average annual rate of population growth between now and 2070 based on the cohort component. The county has experienced significant population variation during the last 50 years, with a peak experienced in the early 1980s, followed by a sharp population decline. The resulting spike reduces the overall reliability of the consistency, indicating that some year-to-year population variation from forecasts can be expected.
